                                                                                      The invention relates to a process for preparing animal feed by agglomerating feet interestable phytase, which is added before or diving agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal phytase-expressing transgenic plants. These plants provide a feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, substrate profile, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released prosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to creduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                         vel phytases with improved properties such as temperature stability, stability, and substrate specificity, for use in pharmaceuticals and

formulation, comprising phytase (myo-inostrol hexakisphosphate phosphoydrolase) and one or more stabilising agents including phosphoydrolase) and one or more stabilising agents including to phosphoydrolase) and one or more stabilising agents including to a value of malonic, and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a provides a monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its diactary requirements of phosphorus. Although a large amount of phosphate is present in animal to utilise this form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate.
                                                                                                                                                        Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus; phosphate availibility; consensus; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note- "Phytase signal peptide from Aspergillus terreus cbs16.46"

reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a mutant phytase-1 consensus sequence, phytase-1-thermo[8]-Q50T-K91A, which has a temperature optimum and melting point 7 degrees Celsius higher than that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate; food; feed; phytate; manure.

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate obsciency, temperature profile, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present

ó

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositiol and inorganic phosphate. The present sequence represents a phytase sequence from the present The present invention describes improved phytases, preferably with invention.

This invention describes a novel process for the preparation of a consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or pharmaceutical compositions. This sequence is a mutant phytase protein of created from the protein represented in AAW93380.

consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutehn. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutehn are useful in food, feed or pharmaceutical compositions. This sequence is a mutent phytase protein of the invention which does not appear in the specification but has been created from the protein represented in AAW93380.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                             Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds
                                                                                                                                                                                                                                                                                                                                                                       Example 9; Fig 2a-c; 240pp; English.

Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus; phosphate availibility; consensus; phytase-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          formulation, comprising phytase (myo-inositol hexalisphosphate phosphohydrolase) and one or more stabilising agents including xylitol or ribitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcollulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with list dietary requirements of phosphorus. Although a large amount of phosphate is present in animal feed in the form of phytate phosphorus, monogastric animals are unable

to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and pelleting. The present sequence represents a consensus sequence, designated phytase-1, which was derived from the mature phytase sequences from a variety of fungi (AAY69544-Y69556), and additionally contains the Aspergillus terreus cbs116.46 signal peptide at the
                                                                                                                                                                                                                                                                                                                                                                                  N-terminus.

This invention describes a novel process for the preparation of a consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or phymaceutical compositions. This sequence is a mutant phytase protein of the invention which does not appear in the specification but has been created from the protein represented in AMM93380.
                                                                                                                                                                                                                        Preparation of a consensus protein, especially a phytase - using programs to compare evolutionary similarity of sequences
                                                                                                           (HOFF ) HOFFMANN LA ROCHE AG F.

consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase (myo-inositol hexakisphosphate) which acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their pharmaceutical compositions. This sequence is a mutant phytase protein of the invention which does not appear in the specification but has been created from the protein represented in AAW93380.

This sequence represents the ascomycets consensus phytase sequence. The invention relates to variant phytase enzymes with specific amino acid substitutions for improved properties. The phytase variants can be used for liberating phytate levels in animal manure. They can be used in feed or food preparations. The phytase bubstrate. They can be used in feed or food preparations. The phytase DNA can also be used to produce transgenic plants which can be used in feeds or foods. The phytase variants can also be used in soy processing and in the manufacture of inositol or derivatives. The phytase variants can have altered activities such as ph stability, temperature stability, pH profile, temperature profile, specific activity (in particularly in relation to pH and temperature), substrate binding, substrate cleavage pattern, substrate binding, New variant phytase enzymes, used for liberating phosphorus from a phytase substrate, for reducing phytate levels in animal manure and in feed and food preparations – Claim 26; Fig 9a-d; 141pp; English.

Preparing animal feed using a thermostable phytase
                             Example 3; Fig 10; 71pp; English
        WPI; 1999-591030/50.
```

The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously. This sequence represents the consensus phytase-10-thermo(3)-Q50T-K9IA. 467 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
